

Your First Step To Sustainable Agriculture

Farmers have seen that the application of **Monty's Plant Food** can result in a more advanced root system versus those not treated with Monty's. These observations have also shown that a plant better absorbs and utilizes applied systemic herbicides and fungicides.

Monty's Plant Food has a low salt index (<.005%) compared to conventional urea (>50%). Continued use of Monty's will not change the pH of the soil and will not prohibit the natural occurring processes of bacteria and micro-organisms in the soil. We highly recommend good soil management and conducting regular soil tests. To optimize growth, deficient elements should be added to the soil to maintain proper nutritional levels.

Better Root Systems

- improve drought resistance
- improve disease and pest resistance
- improve sustainability
- offset weed pressure

Monty's Plant Food Is

- Absorbed through the leaves
- Translocated throughout the plant
- Compatible with most herbicides, insecticides and fungicides

Always read and follow
label directions

Optimize Your Crops' Potential To

- Increase quantity and quality of your harvest
- Better utilize soil nutrients

"...foliar feeding Monty's on your crops *does not* require an extra pass in the field."

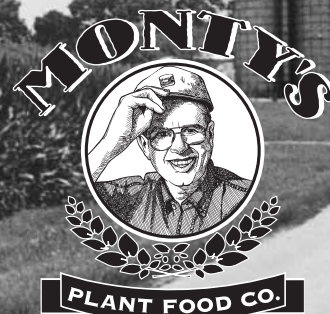

Use On Wheat, Corn, Soybeans, Forage Crops & Vegetables

Bulk is also available in 4,000 gallon tankers and in 20,000 gallon rail cars.

Sustainable Agriculture Products
For a Better Future in Farming

it works!
